◆ADJUSTMENT FOR FM

There are two kind in indication of FM SSG output attenuator.

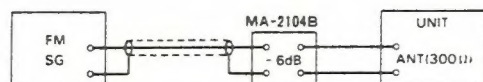

1. Attenuator with marking of 75Ω open open indication type.

2. Attenuator with marking of 75Ω load or close load or close indication type.

FM SG output level in this FM adjustment are described as open indication type.

To feed FM signal, a dummy antenna circuit as Fig. 2-3 must be connected between FM SG output and ANT terminal (300Ω) of the unit.

Fig. 4-2

• The following table shows relations among FM SG attenuator indication (dB), available power ratio (dBf) and antenna terminal voltage (dB/μV) in each indication type.

	FM SG Attenuator Indication	Available Power Ratio	Antenna Terminal Voltage
Open indication type	0 dB 66 dB	—0.8 dBf 65.2 dBf	—6 dB/μV 60 dB/μV
Load or close indication type	0 dB 60 dB	5.2 dBf 65.2 dBf	0 dB/μV 60 dB/μV

10. DESCRIPTION OF ICs, TC9306 AND CXP5014

•TC9306-007 <Digital Tuning System Control>

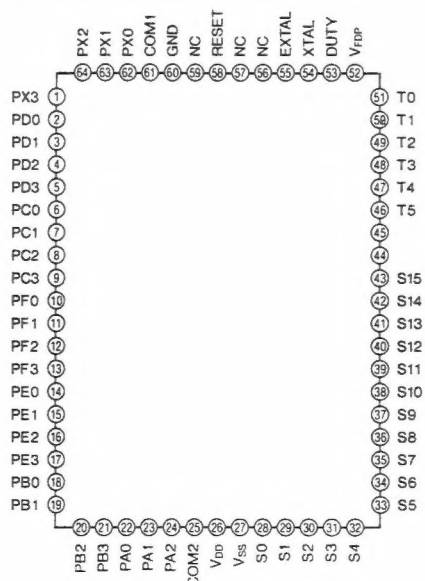

◆ TC9306-007 <Terminal Function>

Pin No.	Pin Name	Function
22 54	COM1 COM2	Terminal for outputting common signals to FL display driver IC. Note: The output is fixed at "L" level automatically when the system is reset or executing CK STP instruction.
1 ~ 21 55 ~ 60	S7 ~ S27 S1 ~ S6	Terminals for outputting segment signals to FL display driver IC. A control of a maximum of 54 segments is possible on the basis of matrix with COM1 and COM2. Data are outputted through these terminals when SEG instruction (COM1 system) or MARK instruction (COM2 system) is executed. Note: The output is fixed at "L" level when the system is reset or executing CK STP instruction.

Pin No.	Pin Name	Function
24 ~ 27	K0 ~ K3	Ports for inputting a 4-bit key matrix signal. On the other hand, key return timing signal is outputted from output ports T0 to T6.
28 ~ 34	T0 ~ T6	Ports for outputting key matrix return timing signals. A 4-bit signal is outputted from T0 to T3, while a 3-bit signal is outputted from T4 to T6.
35 36	A/D IN DC•REF	Terminals for inputting analog signals to 4-built-in A/D converter. The built-in A/D converter is of successive comparison type in dependence upon program. A reference voltage is inputted through DC•REF and an analog comparison voltage is inputted through A/D IN.
41	MUTE	A port for outputting a mute control signal. Note: This output is set to "L" level automatically when INH input changes from "H" to "L" or vice versa.
42 38 37	STB SO SI	Serial interfaces for STB (strobe pulse output), LC7217, CK (serial clock output), SO (serial data output), and SI (serial data input). LC7217 PLL IC is controlled by executing S instruction.
46	CK	Terminal for outputting a reference frequency signal supplied to LC7217 PLL IC. Note: This output is fixed at "L" level automatically when INH input is at "L" level.
47	INT	Terminal for inputting a system resetting signal to device. When INT is at "L" level, the device is reset; when at "H" level, program starts beginning from address No.0. This terminal is usually fixed at "H" level, because the device is reset when a voltage of 4.5V is supplied to V _{DD} . (power-on reset)
49	TEST	Terminal for inputting a test mode control signal. The device is returned to the normal operation at "L" level or in NC status. This terminal includes a pull-down resistor and fixed at "L" level usually.
50 51	XT XT	Terminals for connecting a quartz oscillator 7.4 MHz.
52	GND	GND Terminal
23 53	V _{DD}	Terminal for applying a device supply voltage. In the normal operation, a voltage of 5V ± 10% is applied; but in back-up condition, the voltage can be reduced to 2V. Further, when voltage of 4.5V is applied to this terminal, the device is reset and then program starts beginning from address No.0 (power-on reset).

•CXP5014 <FL Display Driver>

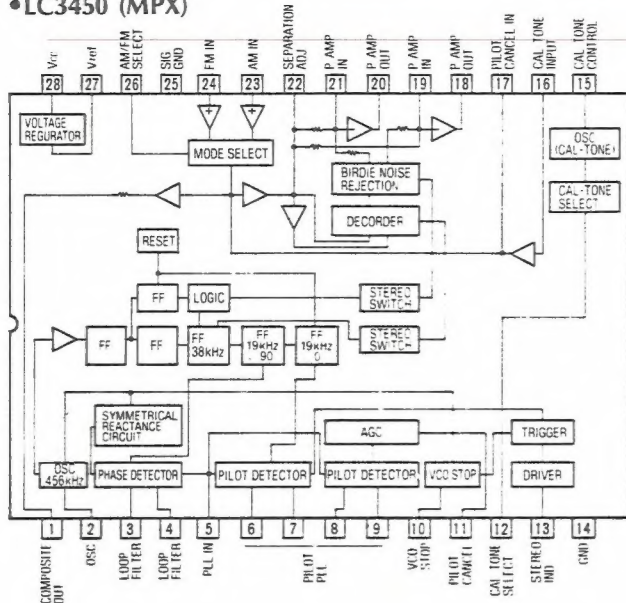

◆ CXP5014 <Terminal Function>

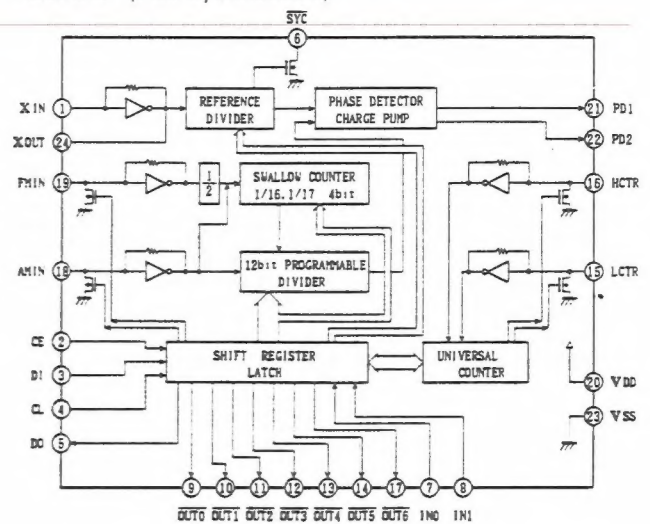

Pin No.	Pin Name	i/O	Description
1 ~ 24	PX3, PDO ~ 3, PC0 ~ 3, PFO ~ 3, PE0 ~ 3, PBO ~ 3, PA0 ~ 2 PX0 ~ 2	i	Terminal for inputting a FL display indicat driving signals.
62 ~ 64	COM2	i	Terminal for inputting common signal for display.
26, 59	V _{DD}	—	Terminals for applying a device supp voltage.
27, 60	GND	—	GND Terminal
28 ~ 43	S1 ~ S15	O	Terminals for outputting segment signals FL display.
46 ~ 51	T5 ~ T0	O	Terminals for outputting grid signals to display.
S2	V _{FDP}	—	Terminal for connecting a supply voltage (- to filament of FL display.
53	DUTY	i	Terminal for setting a display mode for display. Normally this terminal is kept in "L" level.
54, 55	XT, XT	—	Terminal for connecting a quartz oscillat of 3.6 MHz.
58	RESET	—	Terminal for inputting a reset signal.
61	COM1	i	Terminal for inputting common signal for display.
